Note

The valves should not be used on compressors or where pulsating flow exists.

For these applications please consult us.

Pressure Drop Chart

The curves given in the chart are valid for water at 20°C. To read the pressure drop for other fluids the equivalent water volume flowrate must be calculated and used in the graph.

The values indicated in the chart are applicable to spring-assisted valves with horizontal flow. With vertical flow insignificant deviations occur only within the range of partial opening.

$$\dot{V}_w = \dot{V} \cdot \sqrt{\frac{\rho}{1000}}$$

\dot{V}_w = Equivalent water volume flow in l/s or m³/h

ρ = Density of fluid (operating condition) in kg/m³

\dot{V} = Volume of fluid (operating condition) in l/s or m³/h
