HA Aluminium alloy series

H Grey cast iron series

CHA Compact electric motor versions.

HA Fitted for motor coupling version (PAM).

IHA Input shaft versions.

CH Compact electric motor versions.

H Fitted for motor coupling version (PAM).

PH Fitted for motor mounting with flexible coupling.

IH Input shaft versions.

Design features

Motovario products are supplied with the following surface treatment features:

Die-cast aluminium alloy cases for gears

Die-cast materials undergo the following surface cleaning operations:

- De-burring by means of a mechanically operated shearing system
- Accurate shot-peening
- Painting
- Washing and passivation

Grey-coloured cast-iron cases for gears

- Die-cast materials are always painted

Painting specifications:

Orange-peel blue epoxy-polyester RAL 5010. Polyester resin based heat-hardening powders, altered with epoxy resins.

Mechanical properties

- Tests carried out onto degreased Unichim white lattens film thickness: 2.5 mils comply with the following specifications: adherence (ISO2409), Erichsen drawing (ISO152), inverted shock (DIN53158), cone-shaped mandrel (DIN53151), hardness (ASTM D3363/74).

Heat resistance

- 24 HOURS AT 302°F.

Corrosion strength

- ASTM B 117/97 salt fog from 100 to 500 hours depending on the support's preliminary treatment.

Performance:

Loading capacity in accordance with DIN 3990, ISO 6336, AGMA 2101, ISO 10300, DIN 3991, ISO 281, DIN 743

Dynamic efficiency η_d :

The operating efficiency is the ratio between the output power P2 and the power absorbed by the gear reducer P1:

$$\eta_d = P_2/P_1$$

H/HA-range helical gear reducers have an average value equal to:

H..1 stages = 0.97

H..2 stages = 0.96

H..3 stages = 0.94

Product selection guide

For correctly selecting a gear reducer or geared motor, several essential pieces of data are required:

A - The rotational input speed to the gear reducer (**n1**) and the rotational output speed (**n2**).

Through these two values it is possible to calculate the reduction ratio (**i**) of the gear reducer using the following formula:

$$i = \frac{n_1}{n_2}$$

B - The torque required by the application (**Mr2**).

The geared motor or gear reducer can be selected once this data is known.

This guide helps you to select the right product in just a few steps:

Geared motor selection

This guide indicates a brief sequence of steps for selecting a suitable product:

- 1 Determine the application's actual service factor (**s.f.**). This parameter depends on the type of load of the powered machine, the number of starts per hour and the hours of operation (refer to the "Service factor" paragraph on page 5)
- 2 Calculate the input power **Pr1** using the required torque value **Mr2**, the speed **n2** and dynamic efficiency value.

$$Pr_1 = \frac{Mr_2 \cdot n_2}{\mu d \cdot 63.025}$$

The dynamic efficiency value depends on the type of gear reducer and on the number of gear reduction stages. (To calculate the efficiency value see page 3).

- 3 Consult the geared motor performance tables and identify a normalised power value **Pn1** exceeding the required power **Pr1**, such that:

$$Pn_1 \geq Pr_1$$

- 4 Once the suitable nominal power has been identified, select the geared motor capable of generating the rotational speed closest to the desired **n2** value and with service factor **s.f.** greater or equal to that required by the application.

In the geared motor selection tables the combinations include, 4-pole motors powered at 60Hz.

Gear reducer selection

- 1 Determine the application's service factor (**s.f.**) (consult to the "Service factor" paragraph on page 5).
- 2 Calculate the reduction ratio **i** from the requested output speed **n2** and from the input speed **n1**.

$$i = \frac{n_1}{n_2}$$

- 3 Calculate the torque **Mc2** for selecting the gear reducer through the torque required by the application **Mr2** and the service factor **s.f.**:

$$Mc_2 = Mr_2 \cdot (f.s.)$$

- 4 Consult the Gear Reducer Performance tables looking for the reducer that, with the reduction ratio closer to the calculated one, has a nominal torque **M2** so that:

$$M2 \geq Mc_2$$

Checks

Once the gear reducer or geared motor has been selected, the following checks should be performed:

A - Thermal power

The gear reducer's thermal power must be equal to or greater than the installed mechanical power, or the power required by the application according to the indications contained in the section (refer to the "Thermal power" paragraph on page 7).

B - Maximum torque

Generally, the maximum torque (peak instantaneous load) that can be applied to the gear reducer must not exceed 200% of the nominal torque **M2**.

C - Radial loads

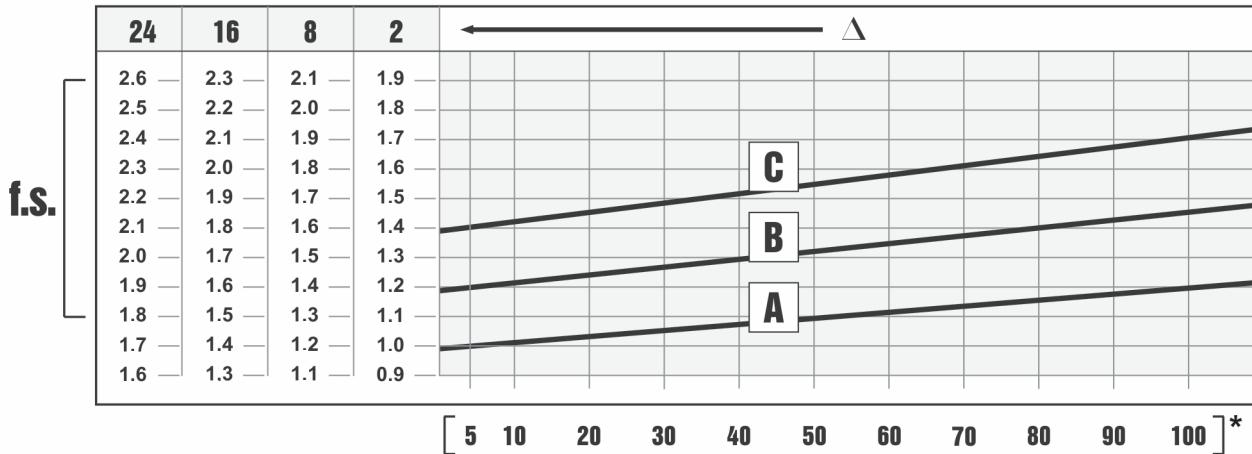

- 1 Verify that the radial loads acting on the input and/or output shafts are within with the values indicated in the catalogue. If they exceed these values, increase the size of the gear reducer or modify the external load capacity.

During the checking phase, it is important to remember that the values indicated in the catalogue refer to loads acting on the mid-point of the shaft protrusion, therefore, if the load is applied to a different position, appropriate formulas must be used to calculate the admissible load in the desired position (refer to the "Radial loads" paragraph on page 10).

- 2 If accessory output shafts are present, make sure that the applied load is compatible with shaft size. If help is needed: contact MOTOVARIO TECHNICAL SERVICE.

- D - If an electric motor is going to be fitted to the selected gear reducer, check for its applicability by referring to the configuration table (see paragraph "Configurations" page 15).

Service factor

The service factor (f.s.) depends on the operating conditions the gear reducer is subjected to. The parameters that need to be taken into consideration to select the most adequate service factor correctly comprise:

- type of load of the operated machine : A - B - C
- length of daily operating time: hours/day (Δ)
- start-up frequency: starts/hour (*)

LOAD: A - uniform $fa \leq 0.3$
 B - moderate shocks $fa \leq 3$
 C - heavy shocks $fa \leq 10$

$fa = Je/Jm$

- Je ($in \cdot lb^2$) moment of reduced external inertia at the drive-shaft
- Jm ($in \cdot lb^2$) moment of inertia of motor

If $fa > 10$ call our Technical Service.

A - Screw feeders for light materials, fans, assembly lines, conveyor belts for light materials, small mixers, lifts, cleaning machines, fillers, control machines.

B - Winding devices, woodworking machine feeders, goods lifts, balancers, threading machines, medium mixers, conveyor belts for heavy materials, winches, sliding doors, fertilizer scrapers, packing machines, concrete mixers, crane mechanisms, milling cutters, folding machines, gear pumps.

C - Mixers for heavy materials, shears, presses, centrifuges, rotating supports, winches and lifts for heavy materials, grinding lathes, stone mills, bucket elevators, drilling machines, hammer mills, cam presses, folding machines, turntables, tumbling barrels, vibrators, shredders.

Critical applications

H	030	040	050	060	080	100	125	140
V5 - V1: 1500 < n1 < 3000	-	-	-	-	-	-	B	B
n1 > 3000	B	B	B	B	B	B	A	A
V3 - V6	B	B	B	B	B	B	B	B

H	A31	A30	A40	A50	A60
V5 - V1: 1500 < n1 < 3000	-	-	-	-	-
n1 > 3000	B	B	B	B	B
V3 - V6	B	B	B	B	B

A - Application not recommended

B - Check the application and/or call our technical service

The performance given in the catalogue correspond to mounting position B3 or similar, ie. when the first stage is not entirely immersed in oil. For other mounting positions and/or particular input speeds, refer to the tables that highlight different critical situations for each size of gear reducer.

It is also necessary to take due consideration of and carefully assess the following applications by calling our Technical Service:

- To avoid the use as multiplier.
- Use in services that could be hazardous for people if the gear reducer fails.
- Applications with especially high inertia.
- Use as a lifting winch.
- Applications with high dynamic strain on the case of the gear reducer.
- In places with T° under 23°F °C or over 104°F.
- Use in chemically aggressive environments.
- Use in a salty environment.
- Mounting positions not envisaged in the catalogue.
- Use in radioactive environments.
- Use in environments pressures other than atmospheric pressure.

Avoid applications where even partial immersion of the reducer is required.

The maximum torque (*) that the reducer can support must not exceed two times the nominal torque (f.s.=1) stated in the performance tables.

(*) intended for momentary overloads due to starting at full load, braking, shocks or other causes, particularly those that are dynamic.

Thermal power Pth [HP]

The table below lists the nominal thermal power values expressed in kW, in the following reference conditions:

- mounting position B3
- continuous operation at input speed <= 1.800 rpm
- ambient temperature 77°F
- sea level altitude
- air speed near the gear reducer >=38ips
- absence of external radial and/or axial loads

Thermal power values at 1.750 rpm			
Gear reducer	Pth [HP]	Gear reducer	Pth [HP]
HA31	/	H081	27
HA41	6.5	H101	38
HA51	9	H121	50
HA61	18	H032	5.6
HA32	5.5	H042	8
HA42	7.5	H052	9
HA52	12.5	H062	15
HA62	18.5	H082	24
H041	7.8	H102	36
H051	9.2	H122	42
H061	12	H142	50

(/) Not available

Applying a power level not exceeding Pth

- at the above-mentioned reference conditions - guarantees the correct lubrication and efficient operation of the gear reducer.

NOTE: checking the thermal power of gear reducer versions with three reduction stages is unnecessary, as the thermal thresholds are not reached.

Application check

Except for continuous operating times below two (2) hours and successive pauses capable of bringing the gear reducer back to ambient temperature, for each application it is advisable to verify the gear reducer's thermal limit according to the following formula:

$$P_m < P_{th} * F_c * F_v * F_a,$$

where:

Pm = input power to the gear reducer at 1.400 rpm (4-pole motors)

Pth = thermal power at the reference conditions (see above table)

Fc = ambient and operating temperature correction factor

Fv = ventilation correction factor

Fa = altitude correction factor

The correction factors refer to different operating conditions compared to the reference conditions, and are provided by the following ISO14179 tables:

Thermal power Pth [HP]

Fc		Duty per hour of operation %				
		100	80	70	40	20
Ambient temperature °F	13.4	1.15	1.21	1.32	1.55	2.07
	24.1	1.07	1.12	1.23	1.44	1.93
	33.5	1.00	1.05	1.15	1.35	1.80
	40.2	0.93	0.98	1.07	1.26	1.67

29527 in	0.95
59055 in	0.90
88582 in	0.85
118110 in	0.81

* Sea level

- In case of operation at input speeds exceeding 2.000 rpm, or ambient temperatures greater than 104°F, it is advisable to contact our technical department.

Installation

To install the gear reducer it is necessary to note the following recommendations:

- Check the correct direction of rotation of the gear reducer output shaft before fitting the unit to the machine.
- In the case of particularly lengthy periods of storage (4/6 months), if the oil seal is not immersed in the lubricant inside the unit, it is recommended to change it since the rubber could stick to the shaft or may even have lost the elasticity it needs to function properly.
- Whenever possible, protect the gear reducer against solar radiation and bad weather.
- Ensure the motor cools correctly by ensuring good passage of air from the fan side.
- In the case of ambient temperatures < 23°F or > 104°F call the Technical Service.
- The various parts (pulleys, gear wheels, couplings, shafts, etc.) must be mounted on the solid or hollow shafts using special threaded holes or other systems that anyhow ensure correct operation without risking damage to the bearings or external parts of the units. Lubricate the surfaces in contact to avoid seizure or oxidation.

- Painting must definitely not go over rubber parts and the holes on the breather plugs, if any.
- For units equipped with oil plugs, replace the closed plug used for shipping with the special breather plug.
- Check the correct level of the lubricant through the indicator, if there is one.
- Starting must take place gradually, without immediately applying the maximum load.
- When there are parts, objects or materials under the motor drive that can be damaged by even limited spillage of oil, special protection should be fitted.

Assembling motor on pam flanges

When the unit is supplied without motor, it is necessary to follow these recommendation to ensure the correct assembly of the electric motor.

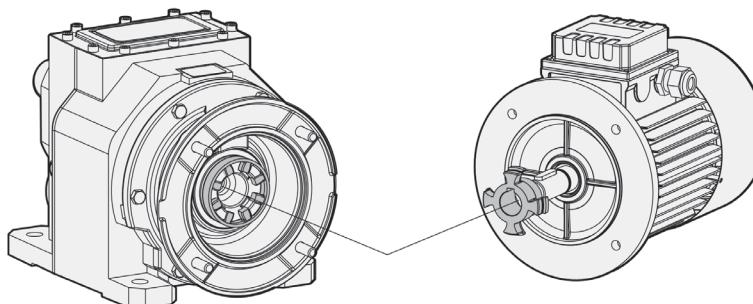

Check that the tolerances for the motor shaft and flange correspond to the "standard". Carefully clean the shaft, spigot and surfaces of the flange removing traces of paint and dirt, and confirm the key is fitted correctly.

Fit the half coupling/sleeve to the motor shaft (see picture) taking care to ensure the motor shaft and bearings are not damaged by avoiding excessive force and where necessary using assembly equipment.

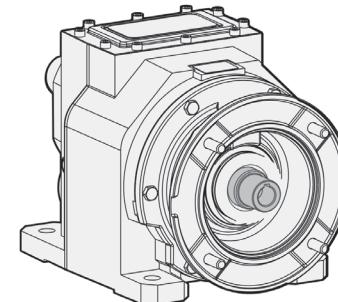

Place the couplings elastic element onto the motor half coupling and position the motor up to the gear unit ensuring the coupling element is aligned with the driven half coupling. Complete the assembly using the fixing bolts.

Key-ways with tightened tolerances.

Flexible joint

PAM Sleeve

Overhung load

The value of the admissible radial load (lb) is given in the tables relating to the performance of the gear reducer at issue. It is related to the load applied on the centre line of the shaft and in the most unfavourable conditions of angle of application and direction of rotation.

The maximum admissible axial loads are 1/5 of the value of the given radial load when they are applied in combination with the radial load.

The tables relating to the output shafts give the maximum admissible value. This value must never be exceeded since it relates to the strength of the case.

Particular conditions of radial load higher than the limits of the catalogue may occur. In this case, call our Technical Service and provide details on the application: direction of the load, direction of rotation of the shaft, type of service.

In case of double extension shafts with radial load applied on both ends, the max. admissible radial loads must be defined according to the specific running conditions, in this case call our Technical Service.

The radial load on the shaft is calculated with the following formula:

$$Fr_e = \frac{2 \cdot M \cdot f_z}{D} \leq Fr_1 \text{ or } Fr_2$$

Fr_e (lb)	Resulting radial load
M (lb-in)	Torque on the shaft
D (in)	Diameter of the transmission member mounted on the shaft
Fr (lb)	Value of the maximum admitted radial load
Fr₁₋₂	(see relative tables)
f_z =	
1.1	gear pinion
1.4	chain wheel
1.7	v-pulley
2.5	flat pulley

When the resulting radial load is not applied on the centre line of the shaft, it is necessary to adjust the admissible radial load Fr_{1-2} with the following formula:

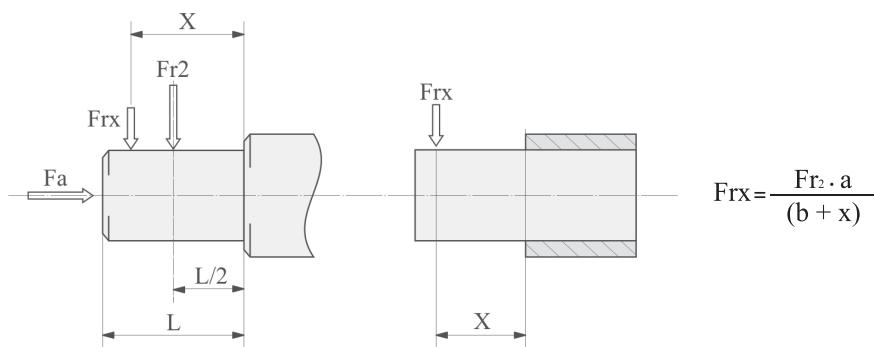

$$Fr_x = \frac{Fr_{1-2} \cdot a}{(b + x)}$$

a, **b** = values given in the tables on page 10 - 11

x = distance from the point of application of the load to the shaft shoulder

Output radial loads

When the radial load is not on the centre line of the shaft, it is necessary to adjust the admissible radial load Fr_2 with the following formula:

H	A31	A41	A51	A61	A32 A33	A42 A43	A52 A53	A62 A63
a	3.09	3.19	3.27	4.06	4.13	4.53	5.31	6.10

Lubrication

In cases of ambient temperatures not envisaged in the table, call our Technical Service. In the case of temperatures under -22°F or over 140°F it is necessary to use oil seals with special properties.

For operating ranges with temperatures under 32°F it is necessary to consider the following:

- 1 The motors need to be suitable for operation at the envisaged ambient temperature.
- 2 The power of the electric motor needs to be adequate for exceeding the higher starting torques required.
- 3 In case of cast-iron gear reducers, pay attention to impact loads since cast iron may have problems of fragility at temperatures under 5°F.
- 4 During the early stages of service, problems of lubrication may arise due to the high level of viscosity taken on by the oil and so it is wise to have a few minutes of rotation under no load.

Oil must be changed after approx. 10,000 hours/2 years of operation; this time varies based on the type of service and on the environment inside which the gear reducer is installed. Units not featuring any oil plug are life-lubricated, and therefore maintenance-free.

HA/H - Lubrication

- For the gear reducer HA series with 2, 3 stages and for the reducers H series with 1, 2, 3 stages it is always necessary to specify the envisaged position.
- The gear reducer HA series with 1, 2, 3 stages all sizes, H series ...with 1 stage sizes 040, 050, 060 and H series ... with 2, 3 stages sizes 030, 040, 050 are supplied complete with lubricant, have no oil plugs and need no maintenance.
- The gear reducer H series ... with 1 stage sizes 80,100,125 and with 2, 3 stages sizes 060, 080, 100, 125, 140 are supplied complete with lubricant and are fitted with oil plugs to suit any mounting position included in the catalogue. It is recommended, after installation, to replace the closed plug used for transportation with the supplied breather plug.

- Quantity of oil in litres

Lubricant quantities are only indicative. For correct filling always refer to the sight glass or the dipstick, when this is supplied.

Any oil level differences can be caused by constructive tolerances but also on the mounting position or the assembly scheme of the customer. Therefore it is very important for the customer to check oil level and if necessary to add the necessary quantity.

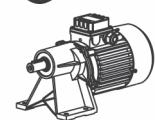

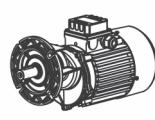

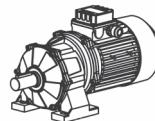

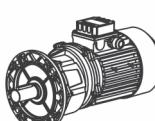

Designation

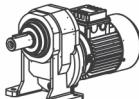

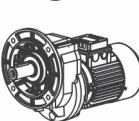

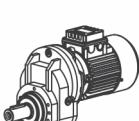

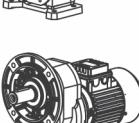

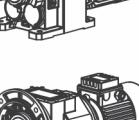

Versions

CH - H - IH

Aluminium alloy series.

- These tables report all possible dimensions. Please verify service factor.

Mounting positions

H..1M**H... - HA...1****H... - HA..2/3**

- For vertical positions, check with pages 6.
- Unless specified otherwise, the standard positions are B3/B5.
- For positions not envisaged, it is necessary to call our Technical Service.

Backstop device

The gear reducer can be supplied with backstop device on input shaft. Backstop device allows output shaft rotation in only one sense of direction; according to the size, it is available in the input flange or in the motor with the same dimensions. It is required to specify on the order the sense of direction, clockwise or counterclockwise, input side.

The reinforced seal can be done depending on the gearbox size by means of two oil seals or through the standard oil seal + VRM ring.

The difference of the two solutions is explained on the above drawings. The helical gear reducers from size 060 to size 140 (except for single stage) in V1/V5 mounting position, are already equipped with 2 oil seals as standard.

As an option, the gear reducer can be supplied with VITON seals.
