

# Power supply CP-C.1 24/10.0

## High-performance primary switch mode power supply

The CP-C.1 power supplies are ABB's high-performance and most advanced range. With excellent efficiency, high reliability and innovative functionality they are prepared for the most demanding industrial applications.

These power supplies have a 150 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combined with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

Giving the power to control.

2CDC 271 010 V0017

## Characteristics

- Rated output voltage 24 V DC
- Power reserve design delivers up to 150 % at  $T_a \leq 40^\circ\text{C}$
- Output voltage adjustable via front-face rotary potentiometer "OUTPUT Adjust", 22.5-28.5 V
- Input voltage range 85-264 V AC, 90-300 V DC
- High efficiency
- Low power dissipation and low heating
- Free convection cooling (no forced cooling)
- Devices with coated PCBAs for harsh environments and with extended temperature range
- ATEX/IECEx approvals for hazardous locations available
- Open-circuit, overload and short-circuit stable
- Integrated input fuse
- DC OK - signaling output "13-14" (relay), power reserve signaling output " $I > I_R$  (transistor)
- Redundancy unit CP-C.1-A-RU offering true redundancy, available as accessory
- Various certifications and approvals (see overview, document no. 2CDC114098D0201)

## Ordering details - CP-C.1

Input voltage range	Rated output voltage / current	PCBA	Type	Order code	Weight (1 pc.) kg (lb)
85-264 V AC, 90-300 V DC	24 V DC / 10 A	uncoated	CP-C.1 24/10.0	1SVR360663R1001	1.07 (2.36)
		coated	CP-C.1 24/10.0-C	1SVR360663R2001	1.09 (2.40)
		uncoated	CP-C.1 24/10.0-L	1SVR361663R1001	1.09 (2.40)

## Related products

Description	Redundancy unit	PCBA	Type	Order code	Weight (1 pc.) kg (lb)

- 6 Circuit diagram
- 7 INPUT L(+), N(-),  $\oplus$ /PE: Input terminals
- 8 Side mounting screw holes for DIN rail  
adapter/lateral mounting

## Application

The primary switch mode power supply CP-C.1 has a wide AC or DC input voltage range. Furthermore the CP-C.1 is equipped with capacitors that ensure a hold-up time of at least 50 ms. This enables worldwide usage and permits safe operation in fluctuating networks and battery-powered applications.

The CP-C.1 power supplies with the robust metallic housing and the reliable construction are suitable for applications in industrial environments. The CP-C.1-C units, having coated PCBAs, enable usage in even harsh industrial environments.

The power reserve of up to 150 % enables trouble-free starting of heavy loads eliminating the need of usage of an oversized power supply.

## Power reserve

The primary switch mode power supply CP-C.1 is equipped with a power reserve functionality to handle the start-up of particular heavy loads (e.g. of a capacitive load or a motor). To ensure that heavy loads are started up, the CP-C.1 delivers additionally up to 150 % of the rated output current to secure the operation of the application. This status is displayed by the yellow LED labelled POWER RESERVE  $I > I_R$ .

## Signaling output

For the communication of the status of the power supply the CP-C.1 is equipped with a relay output to signal output OK as well as a transistor output to indicate when the power reserve is active. These signals can be used for communication to a higher level control system e.g. a PLC.

## Adjustable output voltage

The CP-C range power supplies feature a continuously adjustable output voltage of 22.5 to 28.5 V DC. Thus they can be optimally adapted to the application, e.g. compensating the voltage drop caused by a long line length.

# LED and relay state table

Output OK - relay output

Power reserve - transistor output

## LEDs and signaling outputs

Output voltage	Output OK: LED green	Relay 13-14
$\geq 92\%$ of $U_{out}$		Closed
$< 90\%$ of $U_{out}$		Open

Output voltage	Output OK: LED yellow	Transistor $I > I_R$
$I \leq I_R$	OFF	ON (closed)
$I > I_R$		OFF (open)

It is possible to use the messaging and signaling functionality with power supplies connected in parallel. The parallel operation has no influence on the function.

# Operating mode

## Parallel operation

There are two main reasons for a parallel connection of power supplies:

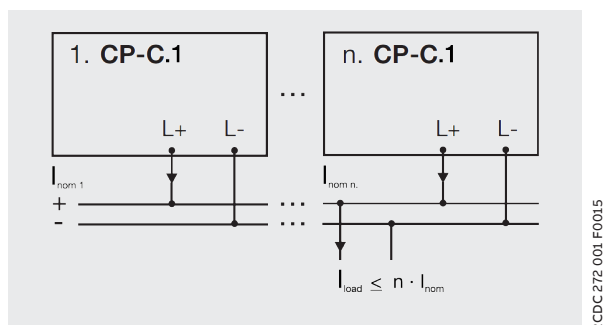

- Increase of power
- Redundancy

Up to 5 devices of the same type can be connected in parallel. For safe and reliable operation it is important to follow the recommendations given in the following section.

## Parallel connection of power supplies for increased power

If the current required by the load is higher than a single power supply can deliver, for example after the expansion of an existing installation, an increase of the output power can be obtained by connecting power supplies in parallel. The following prerequisites have to be fulfilled when connecting power supplies in parallel for the purpose of increased power:

- The paralleled devices must be of the identical type.
- Repeated voltage drops on the supply lines or at the terminals would lead to unbalanced load at the common connection point. To prevent this, you have to observe the following when connecting the power supply units:
  - Identical lengths of the load supply lines.
  - Identical conductor cross sections of the load supply lines.
  - Terminal screws have to be fastened with the same torque to guarantee equal contact resistances.
  - The output voltages of the power supplies must not differ by more than 50 mV. Otherwise, safe operation is not possible.

Installation for increased power

Correct wiring for increased power

Incorrect wiring for increased power

### Important

The devices must not be connected directly to each other! This could lead to an overload of the terminals since the terminals are dimensioned for the maximum output current of a single power supply only. Always use a common connection point!

## Parallel connection of power supplies for redundancy

Several power supplies are connected in parallel in order to guarantee continuous operation of the system if one power supply fails. CP-C.1 can be used in two different redundancy modes depending on what type of redundancy is required:

- Simple redundancy, n+1
- True redundancy

### Simple redundancy, n+1 redundancy

For simple or n+1 redundancy, the power supplies are connected in parallel like for the increase of capacity. To achieve redundancy the current required by the load must not exceed the maximum output power of one single power supply (in case of “1+1 redundancy”) or n power supplies (where n is max. 4).

We recommend connecting the primary sides of the power supplies to different phases of the mains in order to obtain continuous operation of the system if one phase fails.

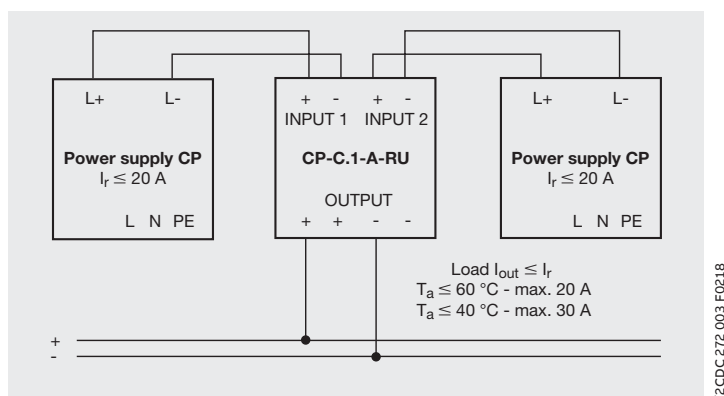

Simple redundancy or n+1 setup

### True redundancy

True redundancy gives higher system availability compared to simple or n+1 redundancy. In a true redundancy setup the power supplies are decoupled from each other with decoupling diodes. This protects the individual power supplies from affecting each other in case of failure of one unit or short circuit on the secondary side or in the wiring.

For two inputs of up to 30 A and one output up to 60 A the ABB redundancy unit CP-C.1-A-RU (available as an accessory) can be used.

The inputs of these units are connected to the terminals L+ and L- of the power supplies. The loads are supplied directly from the outputs of the redundancy unit.

True redundancy using a CP-C.1-A-RU redundancy unit

# Mounting

To mount the power supply place the upper edge of the DIN rail adapter on the upper edge of the DIN rail holding the unit slightly tilted upwards as shown in the illustration. Then tilt the unit down until the latch snaps onto the DIN rail.

## Mounting positions

In order to ensure a sufficient convection in mounting position 1 and 7, the minimum distance to other modules must not be less than 25 mm in vertical direction and 25 mm in horizontal direction. For the derating of the output current, see the characteristic curve of temperature. Details for other mounting positions on request.

## Mounting CP-C.1 in position 7

To mount the power supply in position 7 remove the DIN rail adapter that is fasten with 4 screws and attach it on the side of the power supply.

**Screwdriver:** Torx T10

**Tightening torque:**  $0.7 \pm 0.1$  Nm

## Demounting

To release the power supply pull the latching lever downwards with a screwdriver and press the upper side of the the latching lever down. The device can be unhinged from the DIN rail and removed.

2CDC 273 003 F0015

## Electrical connection

Connect the input terminals “L” to line and “N” to neutral conductor or to + and - with DC supply “+” to “L” and “-” to “N”. The protective earth conductor PE must be connected before putting the device into operation. The installation must be executed acc. to EN 60950. Provide a suitable disconnecting device (e. g. line protection switch, MCB or fuse) in the supply line. The input side of the power supply is protected by an internal input fuse.

The wiring, cable choice and their protection shall comply to the local electrical standard. We recommend choosing the conductor cross-section as large as possible in order to minimize voltage drops. Check the polarity. The device is overload, short-circuit and open-circuit proof. The secondary side of the power supply is electrically isolated from the input and internally not earthed (SELV) and can be earthed for PELV.

Connection diagram

### 24 and 48 V DC connection

The connection diagram below shows how to setup two power supplies for +/-24 or 48 V DC output voltage.-

Connection diagram for +/-24 or 48 V DC output voltage

### Connection to TN, TT networks

The user must refer to and the installation comply with local electrical codes.

The power supply can be connected to electrical supply systems with various earthing systems according to the diagrams below.

TN-S 1-phase

DC source, e.g. battery

TN-C 1-phase

TT 1-phase

In AC networks the input voltage range is defined by -15...+10 % of the rated input voltage. However, in DC networks the rated input voltage is equal to the input voltage range.

## Safety instructions and warnings

### In operation pay attention to:

- Do not modify the installation (primary and secondary side)! High current! Risk of electric arcs and electric shock (danger to life)!
- Risk of burns: Depending on the operation conditions the housing can become hot.
- The device contains no user serviceable parts. In any case of device malfunction please send the unit back to manufacturer.

The device must be installed by qualified persons only and in accordance with the specific national regulations (e. g. VDE, etc.).

The CP-C.1 is a chassis-mounted unit. It is maintenance-free and does not contain any integral setting elements and should therefore not be opened.

### Before any installation, maintenance or modification work:

- Read the operating and installation instructions carefully and completely!
- Disconnect the system from the supply network and protect against switching on!

### Before start of operation the following must be ensured:

- Connection to mains or DC supply according to the specific national regulations for class of protection I.
- Power supply cables and unit must be sufficiently fused. A disconnecting device has to be provided for the end product to disengage unit and supply cables from supply mains if required.
- The protective earth conductor must be connected to the terminal PE.
- Rate the output lines for the output current of the power supply and connect them with the correct polarity.
- In order to ensure sufficient convection the distance to the other devices has to be considered.

### Attention!

Improper installation/operation may impair safety of personnel and cause operational difficulties or destruction of the unit.

### Attention! Danger to life!

Never carry out work when voltage is present. The power supply contains components with high stored energy and circuits with high voltage! Do not introduce any objects into the unit and do not open the unit. With some units of this range the output is capable of providing hazardous energy. Ensure that the service personnel is protected against inadvertent contact with parts carrying energy. If the internal fuse is blown most probably the device is defect. In this case an examination of the device by the manufacturer is necessary.

# Technical diagrams

Data at  $T_a = 25\text{ }^{\circ}\text{C}$ ,  $U_{in} = 230\text{ V AC}$  and rated values, typical values unless otherwise indicated

## Efficiency diagrams

The efficiency and thus the power loss depends on the output current, input voltage, output voltage and ambient temperature as illustrated in the diagrams below.

Typical efficiency over output current

Typical power loss over output current

Typical efficiency over AC input voltage

Typical power loss over AC input voltage

Typical efficiency over ambient temperature

## Characteristic curve of output

Characteristic curve of output at  $T_a = 25\text{ °C}$

## Characteristic curve of temperature

CP-C.1 24/10.0, CP-C.1 24/10.0-L

Characteristic curves of temperature at  $U_{out} = 24\text{ V}$ , mounting position 1

CP-C.1 24/10.0-C

Characteristic curves of temperature at  $U_{out} = 24\text{ V}$ , mounting position 1

The switch mode power supply CP-C.1 is able to supply at 24 V DC output voltage and at an ambient temperature of

- $\leq 40\text{ °C}$  a continuous output current of typ.  $\leq 15\text{ A}$
- $\leq 60\text{ °C}$  the rated current of  $10\text{ A}$

With mounting position 1 and at ambient temperatures of  $> +60\text{ °C}$  the output power has to be reduced by 2.5 % per Celsius degree temperature increase. Deratings for other mounting positions on request.

At thermal overload the device will switch-off as soon as the internal temperature exceeds the acceptable level. The exact ambient temperature threshold depends on the mounting position and load of the power supply.

If the switch mode power supply is loaded with an output current  $> 15\text{ A}$ , the operating point is passing through the U/I characteristic curve shown.

The device is equipped with an overtemperature protection function. It will switch-off as soon as the internal overtemperature protection function is activated.
